1. SAFETY INSTRUCTIONS

Inappropriate handling of hydraulic nuts of the type HMV..EBF can lead to serious injuries and compromise safety.

CAUTION!

The safety instructions provided must be adhered to!

- The operating staff must be authorised!
- The safety instructions and these operating instructions must be complied with in full. They have to be stored with the tools!
- The hydraulic nuts, pump with hydraulic pipe as well as all accessories must be carefully checked for damage before operation - defective or worn parts pose a serious risk and may not be used under any circumstances!
- It must be ensured that there is no air in the hydraulic system - it must be completely bled before operation!
- Never exceed the maximum stroke of the hydraulic nut. (indicated by a Yellow Marker)
- A Pressure gauge must always be connected to check the work pressure!
- The hydraulic nut may only be operated with a manual pump!
- Dirt and oil residues must always be instantly removed!
- Protective goggles must always be worn!
- Changes to the components are not permitted!
- Only use NTN-SNR original spare parts!
- Always use clean hydraulic oil!

CAUTION!

Referring to chapter 2 of this operating instruction a different or additional use of the hydraulic nut is not permitted. The manufacturer is not responsible for damage resulting from inappropriate use. The user retains the overall responsibility and is alone in bearing the risk.

2. PRODUCT DESCRIPTION

The hydraulic nut HMV..EBF is a tool that has been designed to permit the simple mounting and dismounting of rolling bearings with tapered bores. The parts to be installed can be moved into the desired position safely and without excessive use of force.

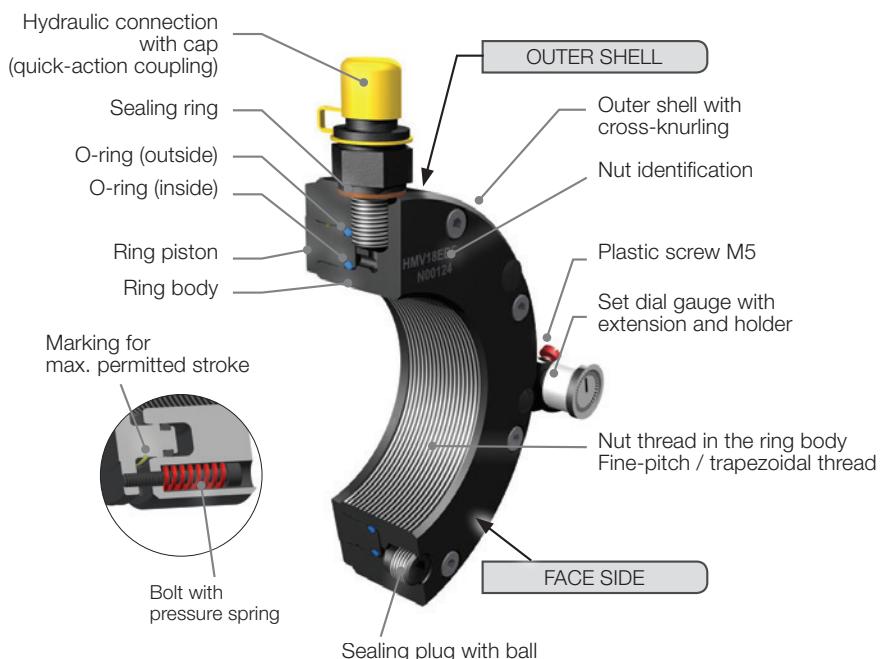

Main area of application

Mounting of rolling bearings (bore taper 1:12 / 1:30) on tapered shafts, adapter sleeves or withdrawal sleeves.

2.1. COMPONENT PARTS

The hydraulic nut mainly consists of the ring body and ring piston. The ring body has an internal thread that is used to screw it onto a shaft or sleeve thread. Hydraulic oil under pressure is used to operate the piston

Two O-rings are used to seal the piston.

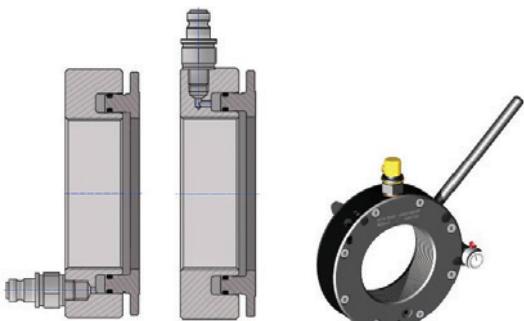

Operating instructions

NTN-SNR HYDRAULIC NUT HMV..EBF

One G1/4 threaded hole is provided in the end face as well as in the outer shell to connect a hydraulic pipe. The threaded hole in the end face is closed at the factory with a sealing plug with ball (*Item 1*). A fast-action coupling (*Item 2*) is screwed into the threaded hole in the outer shell.

Cross-knurling is provided on the outer shell on the hydraulic nut to make it easier to screw it onto a shaft or sleeve thread.

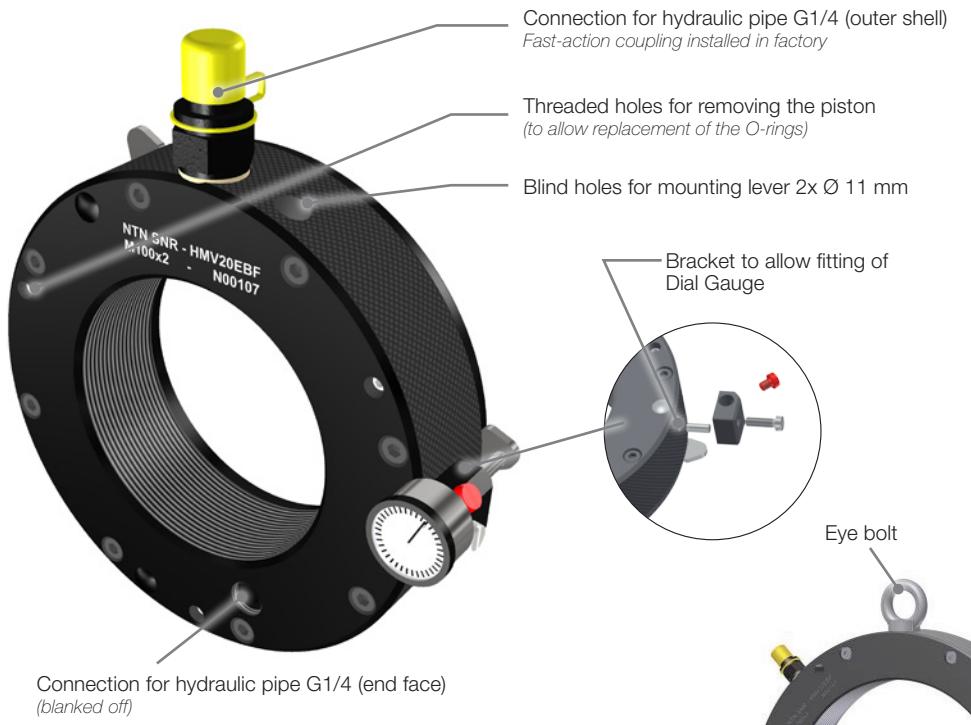

The attached, standard mounting lever (*Item 6*) can also be used for easy turning of the nut. It is an installation aid and is pushed into the blind holes in the outer shell. Bolts with pressure springs (*Item 10*) are circumferentially mounted within the hydraulic nut. They ensure that the piston returns and helps to return the oil into the reservoir of the pump. The piston does not need to be pushed back manually.

Optional connection at:
Face side or Outer shell

Tommy bar

2.2. CONNECTIONS

Hydraulic nuts from size HMV60EBF onwards are equipped with additional threaded holes in the outer shell. The eye bolt included in the delivery can be installed there for better handling.

2.3. PRINCIPLE OF OPERATION

Oil pressure inside the ring body is created by a hydraulic pump and causes the axial advance of the ring piston. This displacement pushes the rolling bearing onto its tapered seat. In order to ensure precise positioning of the rolling bearing, drive up distance should be checked by using a dial gauge.

The ring piston is automatically pushed back to the starting position when the pump pressure is released. The oil automatically flows back into the reservoir of the pump.

3. SPARE PARTS, ACCESSORIES AND TECHNICAL DATA

3.1. HYDRAULIC NUT

Pos	Article		Notice
1	TOOL HMV BALL PLUG 1/4	Sealing plug with ball *	
2	TOOL HMV NIPPLE 1/4	Hydraulic connection *	Consisting of: 1x quick-action coupling with cover 1x adapter thread 1x sealing ring

Max. permitted operating pressure* at max. piston stroke	HMV 10 EBF to HMV 25 EBF HMV 26 EBF to HMV 40 EBF HMV 41 EBF to HMV 60 EBF HMV 62 EBF to HMV 100 EBF HMV 102 EBF to HMV 120 EBF HMV 126 EBF to HMV 160 EBF HMV 170 EBF to HMV 200 EBF	700 bar 550 bar 450 bar 400 bar 350 bar 300 bar 250 bar

* The required operating pressure for mounting and dismounting of rolling bearings is depending on various factors such as size of the bearing, bearing seat quality, numbers of contact surfaces as well as the weight of the rolling bearing.

4. PROCEDURE FOR THE MOUNTING OF ROLLER BEARINGS

Push the bearing by hand as far as possible onto the tapered seat and screw the hydraulic nut onto the thread of the shaft or the sleeve. Ensure that the inner and outer threads are aligned with each other when positioning the nut. It is recommended to use an assembly paste. The start of the thread is marked on the outer shell of the ring body to ease the positioning of larger hydraulic nuts (from HMV90EBF onwards).

Caution: Damage due to cross threading must be avoided.

4.1. BLEEDING OF THE HYDRAULIC SYSTEM

Note:

The hydraulic system must be bled when the nut is used for the first time and after each de-installation of a hydraulic connection.

Screw the whole thread length of the hydraulic nut onto the shaft or sleeve thread and connect the hydraulic pipe to the appropriate hydraulic connection (Item 2).

Turn the sealing plug with ball (Item 1) to the highest position and loosen it slightly. Then pump oil, using the hydraulic pump, until the oil exits without bubbles. Thereafter, firmly close the sealing plug (max. fastening torque 45 Nm).

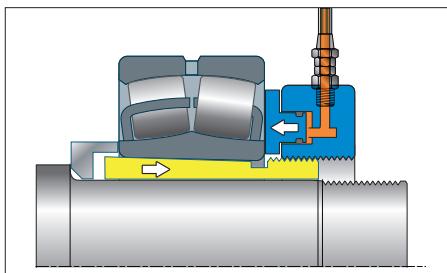

4.2. USE

Screw the hydraulic nut against the rolling bearing until the full annular piston bears evenly on the bearing. The piston must be in its start position and must be fully inserted in the annular body. To absorb the forces that arise during the displacement operation via the thread, a minimum overlap with the mating thread of at least 85% must be guaranteed.

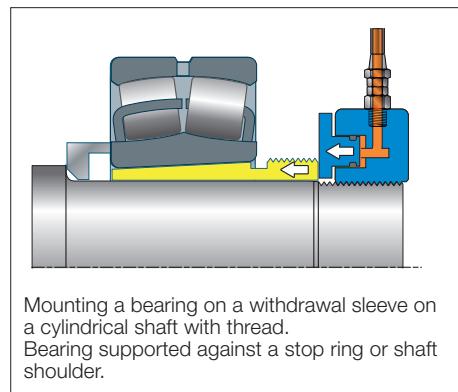

Thereafter, connect the hydraulic pipe to the appropriate hydraulic connection.

5. POSSIBLE MOUNTING / DISMOUNTING SITUATIONS FOR BEARINGS WITH SPHERICAL BORE

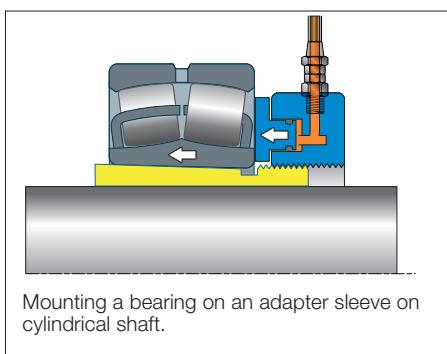

Mounting

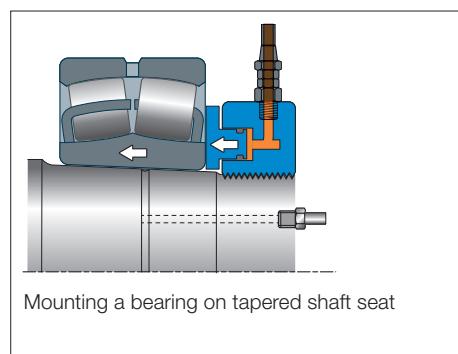

Mounting a rolling bearing on an adapter sleeve on a cylindrical shaft.
The rolling bearing is supported against a stop ring or shaft shoulder.

Mounting a bearing on a withdrawal sleeve on a cylindrical shaft with thread.
Bearing supported against a stop ring or shaft shoulder.

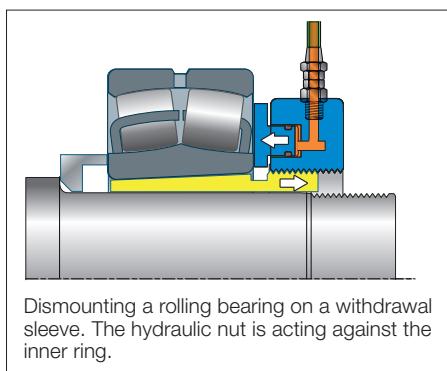

Mounting a bearing on an adapter sleeve on cylindrical shaft.

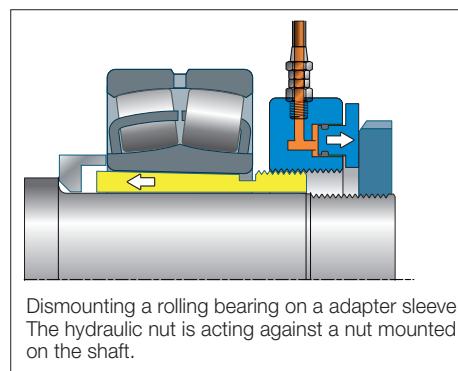

Mounting a bearing on tapered shaft seat

Dismounting

Dismounting a rolling bearing on a withdrawal sleeve. The hydraulic nut is acting against the inner ring.

Dismounting a rolling bearing on a adapter sleeve. The hydraulic nut is acting against a nut mounted on the shaft.

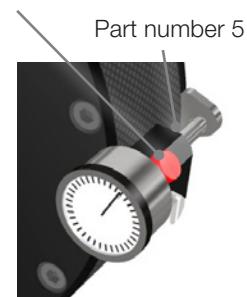

5.1. POSITIONING / AXIAL DISPLACEMENT

5.1.1. Use of a dial gauge

For the mounting process of a roller bearing a dial gauge can be used for measuring the axial displacement. Therefore a dial gauge holder (item 5) can be installed on the face side of the ring body.

(The holder is included to the scope of delivery)

Part number 4

5.1.2. Mounting the dial gauge with holder

The dial gauge holder (item 5) is to be installed only when the HMV is screwed on the thread and the ring piston rests fully against the bearing. This is to prevent injury while turning the nut and to avoid damage to the sensitive dial gauge.

The dial gauge holder is mounted radially with the cap head screw (M5) in one of the three possible positions on the ring body. The dowel pin in the holder helps to locate its position. Insert the dial gauge with the extension into the bore of the holder until the tip of the extension contacts the measurement surface appropriate of the ring piston.

Lock the dial gauge with the plastic screw (M5) (Item 4) so that it cannot slide. Turn the adjustment ring of the dial gauge to the zero position set and establish what axial displacement is required for the bearing to be fitted.

Note

The axial displacement depends on the clearance group and the size of the roller bearing. The values for spherical roller-bearings are provided in the table shown in chapter 8.

Hydraulic oil is now pumped into the hydraulic nut using a hand pump. The ring piston moves the roller bearing onto the sleeve or the tapered bearing seat.

The pumping process is to be continued until the prescribed displacement has been reached. It is recommended to make a final inspection of the internal clearance in the mounted position after the pressure has been released using feeler gauges.

CAUTION!

A circumferential, yellow marking on the ring piston shows that the maximum permitted stroke has been reached. As soon as this marker is aligned with the edge of the ring body, the ring piston may not be pumped out of the ring body any further (risk of injury / damage to the hydraulic nut).

Open the pressure release valve to allow the removal of the nut. The annular piston automatically travels back to its starting position on the hand pump and presses the hydraulic oil out of the hydraulic nut and into the pump as it does so. The hydraulic nut can now be dismounted. The press-fitted assembly must now be fastened with a lock nut and a lock washer.

6. SERVICING AND MAINTENANCE

Dirt and oil residues must be removed from the surfaces after every use to ensure flawless and safe functioning of the hydraulic nut and the hydraulic components.

Hydraulic connections and threads must be checked for possible damage.

The hydraulic connections must be safely capped with covers after use and protected against the penetration of dirt.

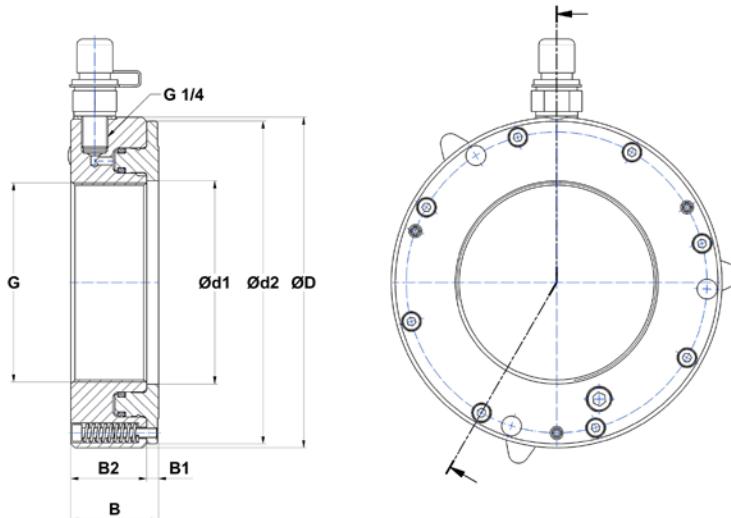

Make sure that the employed hydraulic oil is clean and complies with the required specifications (ISO 11158). The pump tank must always be filled with sufficient oil.

If hydraulic oil emerges from the hydraulic nut during use, the O- rings may be defective (or the maximum stroke of the nut has been reached check if yellow mark is visible).

For replacement of the O- rings, please return the hydraulic nut to NTN-SNR.

For further information, please contact NTN-SNR.

Push the rolling bearing onto the taper bearing seat and manually screw the hydraulic nut onto the thread of the shaft or sleeve until it is in full contact with the bearing. The hydraulic nut is in the starting position. Connect the hydraulic pump to the hydraulic nut and push the rolling bearing into its mounted position by means of hydraulic pressure. After the correct axial displacement has been achieved, the hydraulic pressure should be released allowing the piston to return. The internal clearance should then be checked with feeler gauges.

Operating instructions
